1 Executive Summary

The purpose for this project is creating a recommender system using MovieLens dataset.

The version of movielens dataset used for this final assignment contains approximately 10 Milions of movies ratings, divided in 9 Milions for training and one Milion for validation. It is a small subset of a much larger (and famous) dataset with several millions of ratings. Into the training dataset there are approximately

70.000 users and **11.000 different movies** divided in 20 genres such as Action, Adventure, Horror, Drama, Thriller and more

After a initial data exploration, the recommender systems builted on this dataset are evaluated and choosen based on the RMSE - Root Mean Squared Error that should be at least lower than **0.87750**.

$$RMSE = \frac{1}{n} \frac{}{n_{t=1}} \frac{e_t^2}{e_t^2}$$

For accomplishing this goal, the **Regularized Movie+User+Genre Model** is capable to reach a RMSE of **0.8628**, that is really good.

2 Exploratory Data Analysis

2.1 Inital data Exploration

The 10 Millions dataset is divided into two dataset: edx for training purpose and validation for the validation phase.

The edx dataset contains approximately 9 Millions of rows with 70.000 different users and 11.000 movies with rating score between 0.5 and 5. There is no missing values (0 or NA).

edx dataset

Users	Movies	
69878	10677	

Missing Values per Column

	X
userId	0
movieId	0
rating	0
timestamp	0
title	0
genres	0

The features/variables/columns in both datasets are six:

- **userId** <integer>that contains the unique identification number for each user.
- movieId \(\frac{\text{numeric}}{\text{that contains the unique identification number for each movie.}\)
- rating \(\)numer \(i \)c \(\) that contains the rating of one movie by one user. Ratings are made on a 5-Star scale with half-star increments.
- **timestamp** < integer > that contains the timestamp for one specific rating provided by one user.
- **title** < character > that contains the title of each movie including the year of the release.
- genres <character>that contains a list of pipe-separated of genre of each movie.

First 6 Rows of edx dataset

userId	movieId	rating	timestamp	title	genres
1	122	5	838985046	Boomerang (1992)	Comedy Romance
1	185	5	838983525	Net, The (1995)	Action Crime Thriller
1	231	5	838983392	Dumb & Dumber (1994)	Comedy
1	292	5	838983421	Outbreak (1995)	Action Drama Sci-Fi Thriller
1	316	5	838983392	Stargate (1994)	Action Adventure Sci-Fi
1	329	5	838983392	Star Trek: Generations (1994)	Action Adventure Drama Sci-Fi

2.2 Dataset Pre-Processing and Feature Engineering

After a initial data exploration, we notice that the genres are pipe-separated values. It's necessary to extract them for more consisten, robust and precise estimate. We also observe that the title contains the year where the movie war released and this it could be necessary to predic the movie rating. Finally, we can extract the year and the month for each rating.

The pre-processing phase is composed by this steps:

- 1. Convert timestamp to a human readable date format;
- 2.Extract the month and the year from the date; 3.Extract the release year for each movie from the title;
- 4. Separate each genre from the pipe-separated value. It increases the size of both datasets.

After preprocessing the data, edx dataset looks like this:

Processed edx datadaset

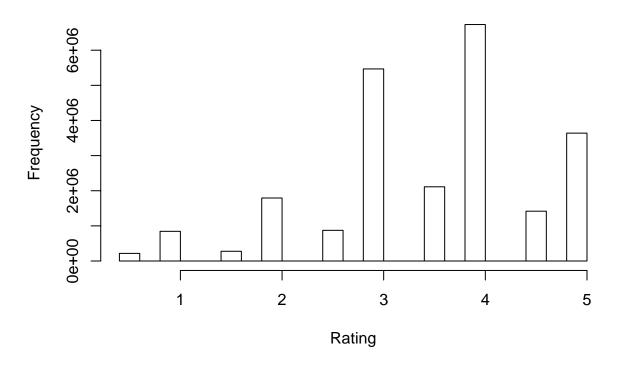

userId	movieId	rating	title	genre	release	yearOfRate	monthOfRate
1	122	5	Boomerang	Comedy	1992	1996	8
1	122	5	Boomerang	Romance	1992	1996	8
1	185	5	Net, The	Action	1995	1996	8
1	185	5	Net, The	Crime	1995	1996	8
1	185	5	Net, The	Thriller	1995	1996	8
1	231	5	Dumb & Dumber	Comedy	1994	1996	8

2.3 Rating Distribution

Overview of Rating Distribution

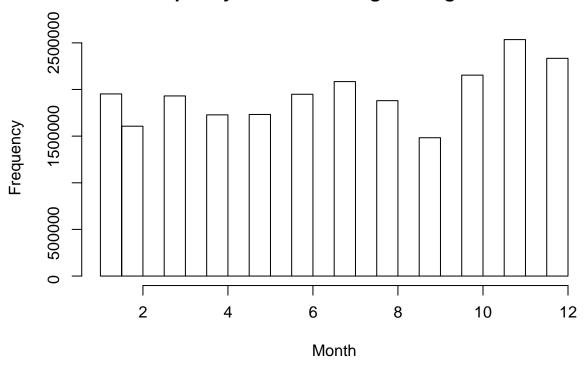

According to the histogram below, it shows that there are a small amount of negative votes (below 3). Maybe, the user tends to give a vote if he liked the movie. Half-Star votes are less common than "Full-Star" votes.

3 Analysis - Model Building and Evaluation

3.1 Naive Baseline Model

The simplest model that someone can build, is a Naive Model that predict ALWAYS the mean. In this case, the mean is approximately 3.5.

[1] "The mean is: 3.52700364195256"

3.1.1 Naive Mean-Baseline Model

The formula used is:

$$Y_{u,i} = \hat{\mu} + \varepsilon_{u,i}$$

With $\hat{\mu}$ is the mean and $\varepsilon_{i,u}$ is the independent errors sampled from the same distribution centered at 0.

The RMSE on the validation dataset is **1.05**. It is very far for the target RMSE (below 0.87) and that indicates poor performance for the model.

3.2 Movie-Based Model, a Content-based Approach

The first Non-Naive Model takes into account the content. In this case the movies that are rated higher or lower respect to each other.

The formula used is:

$$Y_{u,i} = \hat{\mu} + b_i + s_{u,i}$$

With $\hat{\mu}$ is the mean and $\varepsilon_{i,u}$ is the independent errors sampled from the same distribution centered at 0. The b_i is a measure for the popularity of movie i, i.e. the bias of movie i.

The RMSE on the validation dataset is **0.94**. It better than the Naive Mean-Baseline Model, but it is also very far from the target RMSE (below 0.87) and that indicates poor performance for the model.

3.3 Movie + User Model, a User-based approach

The second Non-Naive Model consider that the users have different tastes and rate differently. The formula used is:

$$Y_{ii,i} = \hat{\mu} + b_i + b_{ii} + s_{ii,i}$$

With $\hat{\mu}$ is the mean and $\varepsilon_{i,u}$ is the independent errors sampled from the same distribution centered at 0. The b_i is a measure for the popularity of movie i, i.e. the bias of movie i. The b_u is a measure for the mildness of user u, i.e. the bias of user u.

The RMSE on the validation dataset is **0.8635** and this is very good. The Movie+User Based Model reaches the desidered performance but applying the regularization techniques, can improve the performance just a little.

3.4 Movie + User + Genre Model, the Genre Popularity

The formula used is:

$$Y_{u,i} = \hat{\mu} + b_i + b_u + b_{u,g} + s_{u,i}$$

With $\hat{\mu}$ is the mean and $\varepsilon_{i,u}$ is the independent errors sampled from the same distribution centered at 0. The b_i is a measure for the popularity of movie i, i.e. the bias of movie i. The b_u is a measure for the mildness of user u, i.e. the bias of user u. The $b_{u,q}$ is a measure for how much a user u likes the genre g.

The RMSE on the validation dataset is **0.8634** and this is very good. The Movie+User+Genre Based Model reaches the desidered performance but adding the genre predictor, doesn't improve significantly the model's performance. Applying the regularization techniques, can improve the performance just a little.

3.5 Regularization

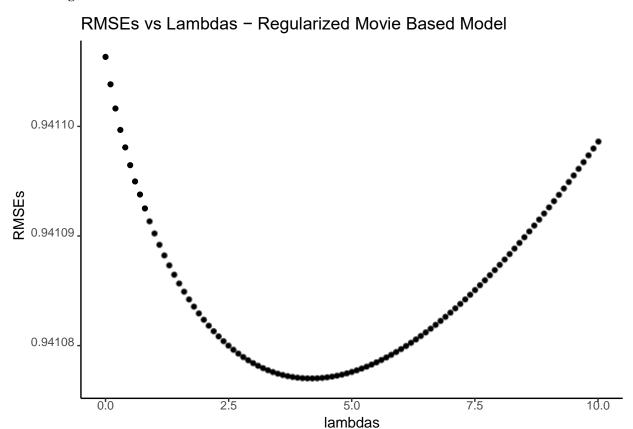

The regularization method allows us to add a penalty λ (lambda) to penalizes movies with large estimates from a small sample size. In order to optimize b_i , it necessary to use this equation:

$$\underbrace{\frac{1}{N}}_{u,i} \underbrace{(y_{u,i} - \mu - b)^2 + \lambda}_{i} \underbrace{\sum_{j} b^2}_{i}$$

reduced to this equation:

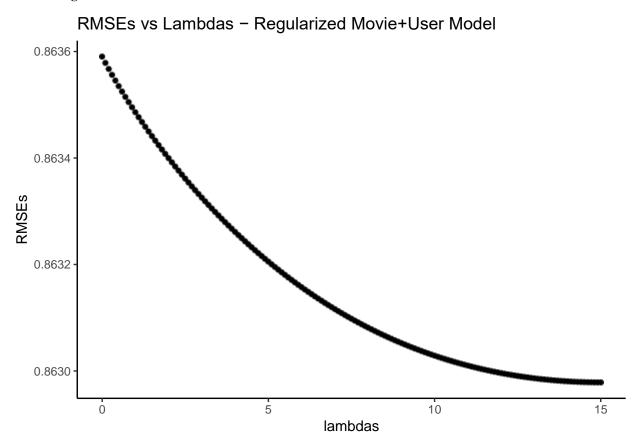

$$\underline{b(\lambda)} = \sum_{i} n_{i} (Y_{u,i} - \hat{\mu})$$

3.5.1 Regularized Movie-Based Model

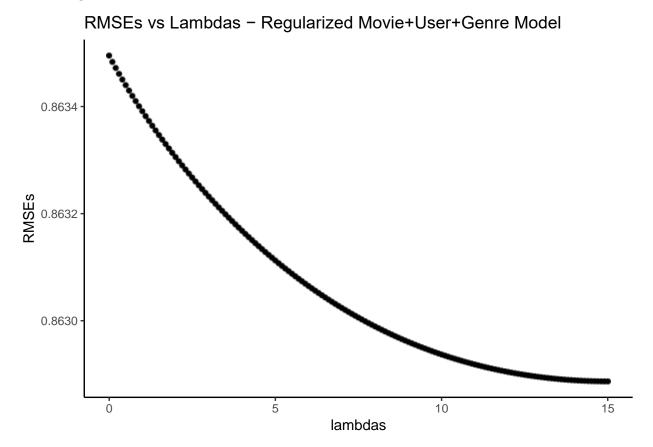

The RMSE on the validation dataset is 0.8635 and this is very good. The Movie+User Based Model reaches the desidered performance but applying the regularization techniques, can improve the performance just a little.

3.5.2 Regularized Movie+User Model

The RMSE on the validation dataset is $\bf 0.8629$. The Regularized Movie+User Based Model improves just a little the result of the Non-Regularized Model.

3.5.3 Regularized Movie+User+Genre Model

The RMSE on the validation dataset is **0.8628** and this is the best result of the builted models. The Regularized Movie+User+Genre Based Model improves just a little the result of the Non-Regularized Model. As the Non-Regularized Model, the genre predictor doesn't improve significantly the model's performance.

4 Results

This is the summary results for all the model builted, trained on edx dataset and validated on the validation dataset.

model	RMSE
Naive Mean-Baseline Model	1.0524433
Movie-Based Model	0.9411063
Movie+User Based Model	0.8635899
Movie+User+Genre Based Model	0.8634946
Regularized Movie-Based Model	0.9410767
Regularized Movie+User Based Model	0.8629791
Regularized Movie+User+Genre Based Model	0.8628874

5 Conclusion

After training different models, it's very clear that movieId and userId contribute more than the genre predictor. Without regularization, the model can archieves and overtakes the desidered performance, but the

best is the enemy of the good and applying regularization and adding the genre predictor, it make possible to reach a RSME of **0.8628** that is the best result for the trained models.
